ABSTRACT:

PROBLEM TO BE SOLVED: To daily surely input data off-line by using a mobile PC, and to dispense with reinput of the data by forming a work flow application, on the basis of data on a work sheet of table calculation software.

SOLUTION: In this work flow item slip forming system, a work flow processor has a work flow server including first software provided with an object for processing an uploading file. The work flow server starts the object of the software for processing the file, when uploading a data inputted file off-line via a network by a client PC by using second software installed in the client PC, processes the uploaded file via the started object, takes out information, and forms a slip by starting the work flow application, on the basis of the taken-out information by starting the object of work flow software.
